Based on our project's 17 unique source files, files 1 – 7 have had the most recent contributions. Notably, two key team members have made the majority of these contributions. Matthew Rollings & Scott Alexander-Brown have contributed to updating/maintaining the project. Rollings has consistently been making numerous updates to fix any bugs we have been aware of. Alexander-Brown has been tweaking the UI (User-Interface) to assist the overall flow of the project better. A noteworthy contributor to files 1 – 7 is Daniel Kutik, who has implemented changes to better help the toolchain for AndroidX. Based upon the scattergram, file eight has had the most contributions out of all the source files as it had the most issues/bugs to resolve. Most, if not all, of the issues, have finally been resolved years back with minor updates in recent years.

Other than the changes listed above, no other vital contributions have been made toward the project since 2021. The decline in changes is a good sign, as the project is mostly polished. Based on the scattergram below, files 10 –17 haven't been updated in years, suggesting that our team members have fully polished these essential files.

It should also be noted that Mathew Rollings has been hands-on with this project since its very start in 2015. His contributions laid the foundation for this project & he continues to implement any changes needed for future changes, as noted with their recent implementations for files 1 - 7. Any further project changes will likely be bug fixes / UI changes. Finally, due to the polished code, we expect the project to receive less support from team members over the next few years.
